Let's Start!

UML 2.0 Interaction Diagrams

Learning Outcome:

Describe common simple incidents at work in a simple spoken or written situation with a supportive interlocutor. Assess the incident of data in the macrosystem processes, based on the data dictionary to consolidate intervening data, based in established parameters.

Can Do Statements:

- I can list some modelling diagrams used in UML2.0.
- I can talk about the different ways UML2.0 models object interaction.
- I can summarize important factors for UML2.0.

Ask your partner:

- Do you know what the most recent UML version is?
- How important do you think diagrams are during a software design?

Let's Explore!

Some interaction in class refreshes the memory

Instructions: Read the text below.

Teacher: Lori, what do we have to consider when we talk about diagrams in UML 2.0?

Lori: We have to consider that when we talk about modeling we refer to different ways of modeling objects.

Teacher: What do we have to know about those modeling ways, Lori?

Lori: We model some diagrams to create interactions between the objects, and accepting and sending messages to one another. Also, to create interactions and communication among these objects, we can model an interaction overview and a timing diagram.

Teacher: Thank you Lori. Now Dana, you know that the earlier UML version modeling interaction is different from the 2.0 version. What do we have to know about that?

Dana: We have to know that the basic concept is the same as in the earlier version, but there are some features added to the diagrams in UML 2.0 that make things easier at the moment of the object interaction.

Teacher: Good, Dana. Can you mention those features, please?

Dana: The features we find in 2.0 when we are modeling interactions are four: sequence diagram, communication diagram, interaction overview diagram and timing diagram.

Teacher: That is correct, Dana. In other words, new features in UML 2.0 were added to old concepts to make it more efficient and useful, and the four interaction diagrams use the system framework to enclose an interaction between objects. Is that clear?

**Let's Practice!**

What types of diagrams are there?

Instructions: Select the correct answer(s).

1. The communication diagram _____ the new collaboration diagram.
 - a. is
 - b. are
 - c. There
2. People rarely _____ the Interaction overview diagram.
 - a. using
 - b. uses
 - c. Use
3. The timing diagram _____ time-oriented.
 - a. is
 - b. are
 - c. it's

**Let's Practice!**

What do we have to remember?

Instructions: Organize the mystery sentence.

1. What do we need to know about the new UML?

2. Do you need to present all the types of diagrams?

3. When do you need to use Communication diagrams?

4. Do we need to make a diagram for this program?

5. Do you need to write the same type of diagram?

Extension Activity

Create a poster in which you present the improvements of UML

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Write the improvements in UML
- Create a poster in which you show the types of diagrams available in UML.
- Share your poster with your partners.

Self-Assessment

Yes

No

1. I can summarize the features improved by the last version of UML.

☐
☐

2. I can give examples of the types of modeling diagrams.

☐
☐

3. I can describe the types of diagrams for UML.

☐
☐

Target Words

- timing diagram** (noun): UML 2.0 diagram created to specify the time restriction on the object's messaging
e.g. We can model an interaction overview and a timing diagram.
- communication diagram** (noun): basic view of the messaging between objects in UML 2.0
e.g. Modeling interactions are four: sequence diagram, communication diagram, interaction overview diagram and timing diagram.
- efficient** (adjective): performing effectively without wasting time or materials
e.g. In other words, new features in UML 2.0 were added to old concepts to make it more efficient and useful.
- consider** (verb): to think carefully about something
e.g. What do we have to consider when we talk about diagrams in UML 2.0?
- interaction** (noun): mutual action or influence
e.g. There are some features added to the diagrams in UML 2.0 that make things easier at the moment of the object interaction.
- modelling** (noun): Development of models to visualize and create systems in business and IT development.
e.g. The features we find in 2.0 when we are modeling interactions are four: sequence diagram, communication diagram, interaction overview diagram and timing diagram.

Learning Points

Verbs with infinitives, have to, in information questions

We use "**have to**" to express a strong obligation that comes from external circumstances.

Have to in question form is used to ask if something is really necessary to be done, the structure is:

wh word+ do/does+ subject+ have to+ verb+?

Examples:

What do we have to know about diagrams in UML2.0?

Where does she have to look for information about the last UML version?

Notice that when the auxiliary is used in this form, **have to** keeps its base form.

Examples

- *What do we have to consider when we talk about diagrams in UML 2.0?*
- *What do we have to know about those modeling ways, Lori?*
- *What do we have to know about that?*

Modeling interactions in UML 2.0

As UML 2.0 represents a new dimension in the Unified Modeling Language, it has new features that turned it into a more complete version.

Compared to the previous 1.5 version, the UML 2.0 makes its usage more extensive. UML 2.0 uses new features to increase the usability and is more understandable. Inside this new version we find four modeling interactions that are:

1. **Sequence diagram**: added to achieve a behavioral aim in the system with a view of the interaction between objects.
2. **Communication diagram**: added as a structural interpretation of the messaging objects.
3. **Interaction overview diagram** : added to describe the combination of interactions in a logic sequence.
4. **Timing diagram**: added in 2.0 UML version to specify the time restrictions on messages sent and received in an interaction.

All these diagrams were added to send and receive messages and are inside the objects.

Examples

- *The features we find in 2.0 when we are modeling interactions are four: sequence diagram, communication diagram, interaction overview diagram and timing diagram.*
