Let's Start!

Getting Familiar with POP and OOP

Learning Outcome:

Describe common simple incidents at work in a simple spoken or written situation with a supportive interlocutor.
Assess the incident of data in the macrosystem processes, based on the data dictionary to consolidate intervening data, based in established parameters.

Can Do Statements:

- I can talk about the basic characteristics for procedural programming.
- I can talk about the basic characteristics for object oriented programming.
- I can discuss an example of an object in an object oriented program.

Ask your partner:

- What characteristics does a digitalobject have?
- How do companies develop new software applications?

Let's Explore!

Danna talked about POP and OOP.

Instructions: Read the text below.

Hi, my name is Danna and I am going to talk about procedural programming known as POP, and object oriented program also known as OOP. What did I want to tell you about these two subjects? Well, procedural programming refers to a programming technique that lets programmers decide the way to start a program and put its items into practice sequentially; that means that it focuses on the flow of activities step by step. Thus, the main emphasis stays on decomposing issues into small parts and solve them individually.

Programming techniques allow users to define the course of the programs since they became more interactive and graphical. The object- oriented programming (OOP) is other programming technique that lets programmers define the objects that can take definite actions based on user's data, which means it focuses on the pieces or objects you are working with.

For example a type of car that has properties as wheels, glasses and doors is the object that is included in a class of vehicles. Or a computer that has properties which are descriptive fields associated to it, as a keyboard, a monitor and a mouse; that computer is the object of a class of appliance. What did you get from this lesson? Well, you learnt the importance of programming techniques and you understood the difference between POP and OOP to retrieve or set data in the program you want to develop.

**Let's Practice!**

Let's check some facts about procedural programming.

Instructions: Write the words to correctly complete the sentences. Use words from the box below. Use: based, known, learnt.

1. With OOP, programmers focus on objects and its actions _____ on user's data.
2. Object's properties are also _____ as variable or criteria.
3. We _____ the difference between POP and OOP.

**Let's Practice!**

What is a good example of an object in OOP?

Instructions: Classify the sentences by writing the number of the sentence in the correct category.

1. A cellphone with camera, front camera and flash.
2. An incoming call in a cellphone.
3. A Family house.
4. A house with terrace, front and back yard.
5. A computer connected to a network.
6. A computer with 4GB of memory, 64-bit system and 500GB of hard disk.

Examples of objects in OOP	Not examples of objects in OOP

Extension Activity

Getting information from a programmer

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for any programmer you know.
- Get more information about what is like working as a programmer and about POP and OOP.
- Write down all the new information you got.
- Interchange this information with your classmates.

Self-Assessment

Yes

No

- I look for a real programmer ☐ ☐
- I get information from his/her real experience. ☐ ☐
- I write down a report ☐ ☐
- I talk about what I learnt with my class. ☐ ☐

Target Words

- **procedural** (adjective): related to any establish way for doing something
e.g. I am going to talk about procedural programming.
- **programmer** (noun): a person who works with computer programs
e.g. Well, procedural programming refers to a programming technique that lets programmers decide the way to start a program.
- **sequentially** (adjective): occurring in a particular order
e.g. Programming techniques allow users to define the course of the programs since they became more interactive and graphical.
- **course** (noun): the direction that something moves along
e.g. Programming languages are made to permit users to define the course of the program.
- **property** (noun): a special characteristic of something
e.g. For example, a type of car that has properties as wheels, glasses and doors.
- **appliance** (noun): a household or device created for a particular use
e.g. That computer is the object of a class of appliance.

Learning Points

Simple Past Tense in Affirmative Statements with Both Regular and Irregular Verbs

You use **simple past** when you want to talk about an action that started and finished in the past.

Verbs in English can be **regular** or **irregular**, you can identify them more easily when they are in **simple past**. With **regular verbs** you just have to add **-ed** at the end. On the other hand, **irregular verbs** have a complex change in their structure and must be learned by practice and use.

We ***talked*** last night about the OOP.

I learnt the difference between OOP and POP.

Regular verbs		Irregular verbs	
present	past	present	past
talk	talked	eat	ate
walk	walked	take	took
present	presented	learn	learnt
program	programmed	have	had

Examples

- You learnt the importance of programming languages.
- You understood the difference between POP and OOP.

Learning Points

Simple past tense in information questions

The **simple past** tense is used most of the time to describe events that happened in the past. To get more information about such events, we use **information questions**.

We use information questions to know about a person (who), a fact (what), a place (where), the time (when), a reason (why) or a method or way in which something happens (how) in a sentence.

e.g. **Why** did the programmer use that language?
What did procedural programs focus on?

Who	Asks about someone	Who did this poster?
What	Asks about something	What did programs focus on?
Where	Asks about a place	Where did you put your keys?
When	Asks about the time something happened	When did you leave?
Why	Asks about the reason	Why did you write that?
How	Asks for the method in which something is done	How did you program that game?

Examples

- *What did I mean with this two subjects?*
- *What did you get with this information?*
