Let's Start!

Layouts are important when you are creating your web page.

Learning Outcome:

Describe common simple incidents at work in a simple spoken or written situation with a supportive interlocutor. Assess the incident of data in the macrosystem processes, based on the data dictionary to consolidate intervening data, based in established parameters.

Can Do Statements:

- I can list different layouts in HTML.
- I can talk about different layouts in HTML.
- I can say how to write some commands for layout with tables in HTML.

Ask your partner:

- Do you like to use tables to organize information? Why?
- Which browsers support HTML?

Let's Explore!

Today's lesson is about HTML layouts.

Instructions: Read the text below.

Teacher: Would you like to share the importance of layouts in HTML with us?

Leia: Well, a layout is important to make a web page look better.

Teacher: You have to explain that better.

Leia: Sure, I would like to do it. I mean, it is what makes the website look attractive.

Teacher: Right, even though modern websites are made with CSS and Java because they are more dynamic, you would also like to use simple HTML tables and its attributes combined with other tags to create useful layouts to your websites.

Leia: Would you like to start telling us about the different layouts we can use in HTML, please?

Teacher: Of course. There are three basic layouts in HTML: HTML layout using tables, multiple columns layout using table,s and HTML layouts using DIV, SPAN. The most conventional is the HTML < table > tag because it is arranged in rows and columns. I am going to explain the tags to you. Please, open a new file and we're going to try to do it together. Well, after the regular heading, within the < body > < /body > tags you place < table border="1" > to start with the margin, and then between < tr > < /tr > tags you put < td >Row A, Column A< /td >, with that we have our first row and column so that we can write all the information we want.

Leia: Teacher! I'm sorry, but something is not working here.

Teacher: I'm coming... I see what the problem is. You have to make the table closing with the < /table > tag. Let's continue, you will do the same with the multiple column tag < title >Three Column HTML Layout< /title >, this will display menus, or even advertising if you want. The content appears in multiple pages. Finally, with the DIV, SPAN tag < title >HTML Layouts using DIV, SPAN< /title > which actually works better with CSS, you can group elements. Do you have any questions?

Let's Practice!

What would you like to do with HTML?

Instructions: Organize the mystery questions.

1. you / would / this / How / table / ? / to organize / like

2. a Css / like / Would / you / template? / to use

3. to learn / Would / Java / ? / like / how / you / to use

Let's Practice!

Would you like to help me?

Instructions: Read the dialogue. Write the missing words in the blanks. Use: to put, to remember, to help, to try, to correct, to create.

Mark: Teacher, I'm trying _____ the same table you showed us in the example but it doesn't work. Would you like _____ me?

Teacher: Of course, would you like me _____ your code?
OK, I see here you forgot _____ the closing tag for table. Once you put it, the table will appear. Would you like _____ it?

Mark: Sure, I will teacher. Thanks a lot. What other tips do you think I need _____?

Extension Activity

Let's design a website's layout!

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Imagine you have to create a website. Brainstorm your layout ideas.
- Make the design drafts of your possible layouts.
- Prepare a short presentation to show your layouts. Explain what elements did you consider to create these designs?
- Share your ideas with your classmates.

Self-Assessment

Yes

No

- I define specific layouts according to a possible website. ☐ ☐
- I design some draft versions for these layouts. ☐ ☐
- I explain my designs and describe the elements I took into account to create them. ☐ ☐
- I answer the questions my classmates may have. ☐ ☐

Target Words

- website** (noun): group of web pages joined by links and placed on the World Wide Web
e.g. Modern websites are made with CSS and Java because they are more dynamic.
- attractive** (adjective): having the quality to produce interest
e.g. It is what makes the website look attractive.
- combined** (adjective): made by two or more features
e.g. You would also like to use simple HTML tables and its attributes combined with other tags to create useful layouts to your websites.
- conventional** (adjective): used by most people
e.g. The most conventional is the HTML `< table >` tag.
- rows** (noun): a number of things in a line
e.g. the HTML `< table >` tag is arranged in rows and columns.
- margin** (noun): a border outside the written matter
e.g. You put `< td >Row A, Column A< /td >`, with that we have our first row and column so that we can write all the information we want.

Learning Points

Verbs with Infinitives, Would Like to, in Affirmative Statements and Questions

When there are two verbs together, the second one sometimes goes in the **infinitive form** (*to-*).

In order to use the **infinitive form** of a verb within a sentence, there are few aspects we need to have in mind.

When you use the modal verb **would** with a verb, the second verb always goes in the infinitive form. This is very typical with the combination **would like to**. We use this form to either **ask** or to **say** something in a polite way.

Examples:

***Would** you **like to use** HTML instead of JAVA?
Sarah **would like to make** her website with HTML.*

There are also other verbs that are **always** followed by the **infinitive form**. There is no special rule for these, you have to memorize them.

Example:

*I **want to know** how to use HTML and CSS properly.*

The following are some common verbs which are always followed by the infinitive:

Verbs Followed by Infinitive			
agree	demand	know how	promise
appear	deserve	learn	refuse
arrange	expect	manage	seem
ask	fail	offer	swear
care	happen	plan	tend
choose	hesitate	prepare	threaten
claim	hope	pretend	undertake
decide	intend		

Examples

- *Would you like to share with us the importance of layouts in HTML?*
- *Sure, I would like to do it. I mean, it is what makes the website look attractive.*

Learning Points

Commands for Different Types of HTML Layouts

There are three types of commands of HTML layouts.

Layouts are very important to give a nice look to a website. In HTML we can find three types of layouts and you will see the commands in the chart below.

LAYOUT COMMAND	DESCRIPTION
<code><table> </table></code>	HTML Layout - Using Tables
<code><table> </table></code> <code><tr> </tr></code> <code><td> </td></code>	Multiple Columns Layout - Using Tables
<code><div><div></code> <code> </code>	HTML Layouts - Using DIV, SPAN

Examples

- *The most conventional is the HTML tag because it is arranged in rows and columns.*
- *Start with the margin and then between `<tr>` `</tr>` tags you put `<td>` Row A.*
- *A layout is important when we want to make a web page look better.*
