Let's Start!

Unified Modeling Language's New Version

Learning Outcome:

Describe common simple incidents at work in a simple spoken or written situation with a supportive interlocutor. Assess the incident of data in the macrosystem processes, based on the data dictionary to consolidate intervening data, based in established parameters.

Can Do Statements:

- I can talk about the basic concept for UML and differences with UML 2.0.
- I can talk about the new dimensions that appear in UML 2.0.
- I can discuss the uses of UML infrastructure and UML superstructure.

Ask your partner:

- What do you use UML for?
- How many versions of UML do you know?

Let's Explore!

Darryl explained Rick the difference between UML and UML 2.0

Instructions: Read the text below.

Rick: Hey, Darryl! Do we need to use UML or UML 2.0 for this task?

Darryl: Well, I think it's better to use UML 2.0 because it has a different dimension in the group of Unified Modeling Language. I mean, it is more complex and that can help us.

Rick: I thought they were identical.

Darryl: No, they are not, in 1997 they created UML as a standard language to construct, visualize and document the artifacts of software systems.

Rick: But wait... Do we need to understand UML as a programming language?

Darryl: No, it is not a programming language, but we can use its tools to produce codes in different languages using UML diagrams. With UML 2.0 we have the advantage of adding new features that we can use in an extensive way to develop models and their corresponding systems; that's why I think it can be useful.

Rick: Oh, ok. Do we have a way to differentiate UML from UML 2.0?

Darryl: Actually, there are just two parts that describe the new dimensions in UML 2.0. Firstly, its infrastructure. It defines the basic constructs of the language and you use it to give mechanisms of adjustment, providing a reusable meta-language core. Secondly, its superstructure; it defines the users' constructs and you use to provide better support and better options for the software modeling and behavior, improving the constructs.

Rick: I suppose that they created the new structure to answer a goal of restructuring and polishing UML, and to make its usage, implementation, and adaptation simpler.

Darryl: That's correct! And that is why I told you to use 2.0.

**Let's Practice!****Facts about UML**

Instructions: Circle the correct option to complete the sentence. Read the sentences aloud. Check your pronunciation with your instructor.

1. 1997 was the year when they (release / released / to release) the first specification draft of UML.
2. Providing a standard way to visualize the design of systems (were / was / be) UML's intention.
3. The OMG (is / was / were) in charge of managing the UML.
4. In 2005, ISO (approve / to approve / approved) UML as an ISO standard.

**Let's Practice!****Questions about UML 2.0**

Instructions: Read the following sentences based on the text. Circle True or False.

1. Do you need to understand UML as a programming language?
(hint: is more of a standard language to construct, visualize, and document.)
 - a. Yes
 - b. No
2. If you need to differentiate UML from UML 2.0, infrastructure and superstructure are parts of UML 2.0 only.
 - a. True
 - b. False(hint: they comprise UML 2.0)
3. Do you need to use the superstructure for better support for the modeling and behavior of software?
 - a. No
 - b. Yes(hint: it improves the performance of the software)
4. Does Infrastructure need to relate with the basic constructs of the language?
 - a. Yes
 - b. No(hint: it gives elementary parts of the language)

**Extension Activity**

Let's discuss UML

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Search for more new features in UML 2.0.
- Write a description of such features.
- Create a poster showing the new information.
- Share your writing with a partner.

Self-Assessment**Yes** **No**

- I list the improvements of UML 2.0.
- I interpret and explain the improvements of UML 2.0.
- I organize the new information on a poster.
- I discuss about UML.

☐	☐
☐	☐
☐	☐
☐	☐

**Target Words**

- **extensive** (adjective): of wide extent
e.g. With UML 2.0 we have the advantage of adding new features that we can use in an extensive way to develop models and their corresponding systems.
- **infrastructure** (noun): the basic framework of a system
e.g. Firstly, its infrastructure; it defines the basic constructs of the language and you use it to give mechanisms of adjustment, providing a reusable meta- language core.
- **superstructure** (noun): the overlying framework of a system
e.g. Secondly, its superstructure; it defines the users' constructs and you use to provide better support and better options for the software modeling and behavior, improving the constructs.
- **identical** (adjective): exactly the same in appearance
e.g. I thought they were identical.
- **visualize** (verb): to form a mental image
e.g. In 1997 they created UML as a standard language to construct, visualize and document the artifacts of software systems.
- **advantage** (noun): a feature that is good and helps you succeed
e.g. With UML 2.0 we have the advantage of adding new features that we can use in an extensive way to develop models and their corresponding systems.

Learning Points

Simple Past statements with be and other verbs

When you want to talk about things that happened and already ended use the **simple past**.

To use the simple past you need the past form of the verb.

Follow this structure to form **affirmative statements in past**:

Subject + **verb in past** + complement.

To make **negative sentences in past** you need to see if the verb is be or other verb.

If the verb is be, follow this structure:

Subject + **was or were** + **not** + complement.

For other verbs, use this structure:

Subject + **did** + **not** + **main verb in infinitive** + complement.

Example:

UML 2.0 **added** new features to make things easier.

UML **was** really basic

Some common regular and irregular verbs with their past form are in the chart below:

Verb in present	Verb in past
Be	Was/ Were
Say	Said
Go	Went
Come	Came
Add	Added
Call	Called
Create	Created
launch	launched

Examples

- *I thought they were identical.*
- *In 1997 they created UML as a standard language to construct, visualize and document the artifacts of software systems.*
- *I suppose that they created the new structure to answer a goal of restructuring and polishing UML.*

Learning Points

Verbs with Infinitives, need to, in questions

When you want to talk about actions that are necessities in the contexts you are talking, use **need to**.

When someone ask if something is necessary they use **need to**.

Follow this structure to ask in present using **need to**:

Auxiliary (Do/ Does) + subject+ **need to**+ **verb in infinitive**+ complement + ?

Example:

*Does she **need to use** a heading in her page?*

*Do you **need to create** a web page?*

Auxiliary	Subject	Need to	verb
Do	we	need to	create?
Does	he	need to	write?
Do	I	need to	use a programming language?

Examples

- *Do we need to use UML or UML 2.0 for this task?*
- *Do we need to understand UML as a programming language?*
- *Do we have a way to differentiate UML from UML 2.0?*
