### Let's Start!

How can we add HTML content when programming?

```
<html>  
<head>  
<meta name="description" content="...">  
<meta name="keywords" content="...">  
</head>  
<body bgr...>  
</body>  
</html>
```

#### Learning Outcome:

Describe common simple incidents at work in a simple spoken or written situation with a supportive interlocutor.

Assess the incident of data in the macrosystem processes, based on the data dictionary to consolidate intervening data, based in established parameters.

#### Can Do Statements:

- I can list the different types of basic tags in HTML.
- I can talk about characteristics for different types of basic tags in HTML.
- I can identify commands for different types of basic tags in HTML.

#### Ask your partner:

- Do you think it is important to understand basic software terminologies when developing a website? Why?
- What do you know about programming in HTML?

## Let's Explore!

Today, our class is about basic tags to program in HTML.

*Instructions: Read the text below.*

- Teacher:** Today, we are going to talk about basic tags in HTML. As you may know, HTML is one of the most used markup languages in website or application developing. This programming language works based on tags; these elements can help defining the way a browser format and display the content of a page. Can you name some basic HTML tags?
- Carl:** Well, there are heading, paragraph, centering content, horizontal lines, preserve formatting, nonbreaking spaces, among other tags.
- Teacher:** That's right. Can you explain to us how heading tags work?
- Carl:** All kind of documents even webpages start with headings, so this kind of tag enables to display them. We can choose among six different levels of heading from `< h6 >` to `< h1 >` depending on the size we prefer for our heading. That way, if we want our title to have the biggest size, we need to put the heading between the tags like this: `< h1 >poems< /h1 >`.
- Teacher:** Good job Carl! As you mentioned before, there is also a tag to structure your texts by paragraphs. When you need it, you must use `< p >` for the opening and `< /p >` for the closing. But, in the case, you want to center your content, you have to use the centering content tag; it starts with `< center >` and closes with `< /center >`.
- Carl:** Can you give us some examples of empty elements?
- Teacher:** Sure. Some of the most common empty tags are `< br / >` or `< hr >`. They are called this way because there is no need to put any content between them. `< br / >` or line break tag represents an empty element between lines, and `< hr >` or horizontal lines can be helpful to visualize the break-up sections of your page or application. Do you have any idea about when do we use preserve formatting?
- Carl:** The preformatted tag, `< pre >content< /pre >`, is an element that programmers can use when they want to keep the same format presented in their HTML documents.

### Let's Practice!

Can you name some basic HTML tags?

*Instructions: Match column A with column B.*

#### COLUMN A

1. Can you explain to us how heading tags work?
2. Can you help me with the centering content tags?
3. What can you tell me about paragraph tags?

#### COLUMN B

- a. They start with `< center >` and close with `< /center >`.
- b. You can choose among six different levels of heading from `< h6 >` to `< h1 >`.
- c. When you need them, you must use `< p >` for the opening and `< /p >` for the closing.

### Let's Practice!

Some Features about Basic HTML Tags

*Instructions: Classify the sentences by writing the number of the sentence in the correct category.*

- a. If we want our title to have the biggest size, we need to put the heading between the tags like this: `< h1 >poems< /h1 >`.
- b. All kind of documents even webpages start with headings, so this kind of tag enables to display them on a web page.
- c. Some of the most common empty tags are `< br/ >` or `< hr >`.
- d. As you mentioned before, there is also a tag to structure your texts by paragraphs.
- e. But, in the case, you want to center your content, you have to use the centering content tag.
- f. If we want our title to have the biggest size, we need to put the heading between the tags like this: `< h1 >poems< /h1 >`.

| Use of Possessive Adjectives | Non-Use of Possessive Adjectives |
|------------------------------|----------------------------------|
|                              |                                  |

## Extension Activity

### Creating a Brochure about Basic HTML Tags

*Instructions: Complete the following steps. Fill in the Self-Assessment.*

- Look for more information about basic HTML tags.
- Identify key information about 5 HTML tags.
- Create a brochure in which you explain these 5 tags.
- Use questions and answers in your brochure
- Share your brochure with a partner.

#### Self-Assessment

Yes No

- I look for more information about basic HTML tags. ☐ ☐
- I identify key information about 5 HTML tags. ☐ ☐
- I create a brochure in which I explain these 5 tags ☐ ☐
- I use questions and answers in my brochure. ☐ ☐
- I share my brochure with a partner. ☐ ☐

## Target Words

- **empty** (adjective): without content  
e.g. Some of the most common empty tags are `< br / >` or `< hr >`. They are called this way because there is no need to put any content between them.
- **display** (verb): to show content on a website  
e.g. These elements can help defining the way a browser format and display the content of a page.
- **enable** (verb): to permit something to happen  
e.g. All kind of documents even webpages start with headings, so this kind of tag enables to display them.
- **tag** (noun): a command that specifies the format of a webpage or application  
e.g. This programming language works based on tags.
- **heading** (noun): a title  
e.g. That way, if we want our title to have the biggest size, we need to put the heading between the tags like this: `< h1 >poems< /h1 >`.
- **format** (verb): to organize written information  
e.g. These elements can help defining the way a browser format and display the content of a page.

## Learning Points

### Possessive Adjectives

**Possessive adjectives** are words that modify nouns to show possession or ownership.

You use **possessive adjectives** to show possession of something. As most adjectives, **possessive adjectives** always go *before* the noun or thing that is possessed:

**My** application display isn't working. There may be a coding mistake.  
We are programming **our** page with HTML tags.

When we use **possessive adjectives** with people, we use them in the sense of relationship:

**Their** sister is developing a web app.  
**Her** professor is giving her some tips on how using HTML tags.

The following chart presents the **possessive adjectives** that we can use in English according to the subject pronouns:

| Subject Pronouns | Possessive Adjectives |
|------------------|-----------------------|
| I                | My                    |
| You              | Your                  |
| He               | His                   |
| She              | Her                   |
| It               | Its                   |
| We               | Our                   |
| You              | Your                  |
| They             | Their                 |

### Examples

- *That way, if we want our title to have the biggest size, we need to put the heading between the tags.*
- *The preformatted tag, < pre >content< /pre >, is an element that programmers can use when they want to keep the same format presented in their HTML documents.*

## Learning Points

### Examples of Commands for Basic Tags in HTML

There are different types of **commands** that we can use when programming in HTML.

The chart below presents some commands for basic tags in HTML:

| category         | commands                                                                                                                                                                                                                        |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Global</b>    | <code>&lt;!--...--&gt;</code><br><code>&lt;html&gt;...&lt;/html&gt;</code><br><code>&lt;head&gt;...&lt;/head&gt;</code><br><code>&lt;body&gt;...&lt;/body&gt;</code>                                                            |
| <b>Head</b>      | <code>&lt;link&gt;</code><br><code>&lt;meta&gt;</code><br><code>&lt;base&gt;</code><br><code>&lt;title&gt;...&lt;/title&gt;</code>                                                                                              |
| <b>Body</b>      | <code>&lt;center&gt;...&lt;/center&gt;</code><br><code>&lt;font size=# &gt;...&lt;/font&gt;</code><br><code>&lt;b&gt;...&lt;/b&gt;</code><br><code>&lt;cite&gt;...&lt;/cite&gt;</code><br><code>&lt;h1&gt;...&lt;/h1&gt;</code> |
| <b>Lists</b>     | <code>&lt;ul&gt;...&lt;/ul&gt;</code><br><code>&lt;ol&gt;...&lt;/ol&gt;</code><br><code>&lt;dl&gt;...&lt;/dl&gt;</code><br><code>&lt;li&gt; [...&lt;/li&gt;]</code>                                                             |
| <b>Tables</b>    | <code>&lt;table&gt;...&lt;/table&gt;</code><br><code>&lt;caption&gt;...&lt;/caption&gt;</code><br><code>&lt;tr&gt;...&lt;/tr&gt;</code>                                                                                         |
| <b>Hypertext</b> | <code>&lt;a&gt;...&lt;/a&gt;</code>                                                                                                                                                                                             |
